

Manual Testing Project (by OSTAD)

Task_1 | You have a thermos product-selling e-commerce platform. Now, the client wants to implement a new feature, "Search". During the client meeting, they mentioned they wanted to make the search dynamic, with any keywords or specific text. Now you have a chance to get into more details on the feature. You can ask the client up to 10 questions. List the questions according to priority and add your feedback.

Task_2 | Write down the test cases according to your questions and feedback.

Task_3 | Let's say, your development team implemented the feature on the Evershop site (<https://demo.evershop.io/>). Now execute your test case in the URL and generate a report.

Task_4 | Now there is a happy path journey for searching with the text "Stainless Steel Thermos". For the first item on the list, add a couple of black/white products to your cart. Then verify the Cart. Now execute the journeys from both the API and UI. Now provide feedback on your test analysis, and keep logs of the defects.

NOTE:

- For the API test, export the collection and share the file.
- DON'T USE ANY AI TOOLS.
